4 8 16 In the first call to the function, we only define the argument a, which is a mandatory, positional argument. In the second call, we define a and n, in the order they are defined in the function. Finally, in the third call, we define a as a positional argument, and n as a keyword argument.. If all of the arguments are optional, we can even call the function with no arguments.

.NET supports two types of string formatting. I'm in a situation where existing configuration data has #,##0 style formatting. A new feature requires formatting to the same output, but the API needed for this feature only accepts formatting of type {0:n2}.. Does anyone know of a means to convert between these two representations for numeric types?

Chemical equilibrium refers to the final mixture of a chemical reaction, where the reactants and products are done changing. In a chemical reaction, reactants are converted into products. A general belief is that all chemical reactions proceed to completion (where all reactants are converted into product). But this is not true in all cases. A lot of chemical reactions proceed only to a certain ...
